## Condition Overview

Melanoma is a malignant tumor that originates in melanocytes, the pigment-producing cells of the skin. It is the most aggressive form of skin cancer and can spread rapidly to other parts of the body if not detected early.

Key characteristics

- Appearance: Often presents as a new or changing mole, or an existing mole that becomes asymmetrical, irregular, or develops a new color or border. The ABCDE rule (Asymmetry, Border, Color, Diameter, Evolution) is commonly used for visual assessment.
- Risk factors: Excessive UV exposure, fair skin, a history of sunburns, multiple or atypical moles, a family history of melanoma, and certain genetic syndromes.
- Potential consequences: If untreated, melanoma can metastasize to lymph nodes, liver, lungs, brain, and other organs, leading to significant morbidity and mortality.

---

### Important Precautions

- Seek immediate professional evaluation: Schedule an appointment with a dermatologist or oncologist for a thorough skin examination and, if indicated, a biopsy to confirm the diagnosis.
- Avoid self diagnosis or treatment: Do not attempt to remove or treat suspicious lesions at home.
- Follow the clinician s guidance: If a biopsy confirms melanoma, the treatment plan may involve surgical excision, sentinel lymph node evaluation, and possibly immunotherapy or targeted therapy.
- Sun protection:
- Use broad spectrum sunscreen (SPF 30) and reapply every 2 hours when outdoors.
- Wear protective clothing, wide
